Submission: March 1, 2009

## 1 Let D be a partial order. Prove or disapprove the following statements.

### **1.1** If $S_1 \subseteq D$ and $S_2 \subseteq D$ are directed, then so is $S_1 \cup S_2$ .

This statement is false. Consider a partial order D as displayed in Figure 1. The  $x \to y$  relation depicts a  $x \le y$  order.

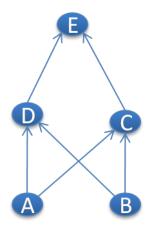

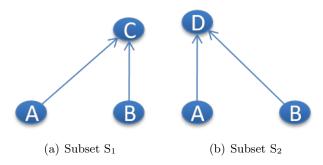

Figure 1: Partially orderd set D

Let there be two subsets  $S_1 = \{A, B, C\}$  and  $S_2 = \{A, B, D\}$  as displayed in Figures (a) and (b).

The union of  $S_1$  and  $S_2$  would not directed, be since (C, D) does not have an upper bound in  $S_1 \cup S_2$  as displayed in Figure 2

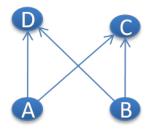

Figure 2: Union of  $S_1$  and  $S_2$ 

#### **1.2** If $S_1 \subseteq D$ and $S_2 \subseteq D$ are directed, then so is $S_1 \cap S_2$ .

This statement is false. Considering the two subsets  $S_1$  and  $S_2$  from 1a, the intersection would be  $\{A, B\}$  as displayed in Figure 3. Obviously, these two elements do not have an upper bound in  $S_1 \cap S_2$ .

Figure 3: Intersection of  $S_1$  and  $S_2$ 

### 1.3 For every $d \in D$ , the set $\{s \in D | s \leq d\}$ is directed.

#### This statement is true:

Let S be the set  $s \in D | s \le d$ .

Since  $\exists s \in S$  for each  $s \in D$  where  $s \leq d$  and because that  $d \in D$  and  $d \leq d$ ,

 $\Rightarrow$  it must be that  $d \in S$ .

Also, for each  $s \in S$ 

- $\Rightarrow$  it must be that  $s \leq d$ .
- $\Rightarrow$  Therefore,  $d \ge \sqcup s$  for each  $s \in S$ .
- $\Rightarrow$  Consequently  $d \ge \sqcup (a,b)$  for each  $(a,b) \in (S \times S)$ , assuming that  $x \ge \sqcup (y,z)$  if  $x \ge \sqcup \{y,z\}$ .
- $\Rightarrow$  Hence, d is upper bound to all two elements of S, thus making S directed.

## 1.4 For every $d \in D$ , the set $\{s \in D | d \le s\}$ is directed.

**This statement if false.** Consider a poset D as displayed in Figure 4 The statement does allow choosing A for d which would result in the entire poset. Consequently, the poset itself would need to be directed. Obviously, B and C have no upper bound, thus the poset is not directed.

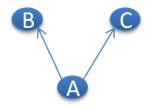

Figure 4: Partially ordered set D

# **2** For a cpo D, consider the function $Apply: [D \to D] \times D \to D$ for which Apply(f,x) = f(x). Prove that Apply is continuous.

As established in class,  $[D \to D]$  denotes a copo of continuous functions. Let this copo be F such that

Apply: 
$$F \times D \to D$$
 (2.1)

Since F is a set of continuous functions, it must be true that

$$\sqcup (f \ D) = f \ \sqcup D \mid \forall f \in F \tag{2.2}$$

When comparing function spaces such as F it is that for all  $f, g \in F$  that

$$f \le g \text{ if } f \ x \le g \ x \quad | \ \forall x \in D \tag{2.3}$$

Since F is a ccpo of functions, it must be that

$$\exists f_i \in F = \sqcup F \tag{2.4}$$

$$\Rightarrow g \le f_i \mid \forall g \in F \tag{2.5}$$

$$\Rightarrow (g \ x \le f_i \ x \mid \forall g \in F) \mid \forall x \in D \tag{2.6}$$

$$\Rightarrow \sqcup (f \ x \mid \forall finF) = (\sqcup F) \ x \mid \forall x \in D \tag{2.7}$$

$$\Rightarrow \sqcup (F \ x) = (\sqcup F) \ x \mid \forall x \in D \tag{2.8}$$

In order for Apply to be continuous, it must be that

Also, it is given that a function is continuous if it is continuous in each of its parameters. Therefore, if Apply is continuous in its parameters, it must be continuous itself as well. By fixing parameters, partially applied functions can be constructed that allow the examination of the properties (such as the continuity) of Apply for the parameters that are not fixed. Consequently, by fixing f, the partially applied function  $Apply_f$  can be constructed, that allows the evaluation of the continuity of Apply in f by fixing f. If both  $Apply_f$  and  $Apply_f$  are continuous, Apply must be continuous, too. Now in order for  $Apply_f$  and  $Apply_x$  to be continuous, it must be true that

$$\sqcup (Apply_f \ D) = Apply_f \ \sqcup D \mid \forall f \in F$$
 (2.10)

$$\sqcup (Apply_x \ F) = Apply_x \ \sqcup F \mid \forall x \in D \tag{2.11}$$

Since Apply(f,x) = f(x), any  $Apply_f(x)$  can also be expressed as f(x). Thus, equation 2.10 results to

$$\sqcup (f \ D) = f \ \sqcup D \mid \forall f \in F \tag{2.12}$$

which is provided by equation 2.2. Consequently it is that  $Apply_f$  is continuous, implying that Apply is continuous in x. Furthermore, Apply(f, x) = f x requires that equation 2.11 results to

$$\sqcup (F \ x) = (\sqcup F) \ x \mid \forall x \in D \tag{2.13}$$

which is provided to equation 2.8. Consequently it is that  $Apply_x$  is continuous, implying that Apply is continuous in f. Thus it is proven that Apply is continuous both in f and in x, Subsequentially, it must be true that Apply is continuous.

3 Let D be a cpo. An element  $x \in D$  is called compact if for every ascending chain  $S \subseteq D$  one has:  $x \sqcup S$  implies  $x \leq s$  for some  $s \in S$ . Show that if x and y are compact and they have a least upper bound in D, then the least upper bound is also compact.

Since x and y are compact, it is given that for all ascending chains  $C \subseteq D$ 

if 
$$x \le \Box C$$
 then  $\exists c \in C$  such that  $x \le c$  (3.1)

with the same being true for y instead of x.

Let's say there is a least upper bound p for  $\{x, y\}$  such that

$$x \le p \land y \le p \tag{3.2}$$

Assume p is not compact, it must be that  $\exists C_i \subseteq D$  so that

$$p \le \sqcup C_i \tag{3.3}$$

Due to equation 3.2 and 3.3, it must be that

$$x \le \sqcup C_i \land y \le \sqcup C_i \tag{3.5}$$

Since x and y are compact and due to equation 3.1, it must also be true that

$$\exists c_1 \in C_i \text{ such that } x \le c_1 \tag{3.6}$$

$$\exists c_2 \in C_i \text{ such that } y \le c_2 \tag{3.7}$$

With  $c_1$  and  $c_2$  being elements of the same ascending chain, it is that

$$\exists c_i \in C_i = \sqcup \{c_1, c_2\} \tag{3.8}$$

$$\Rightarrow x \le c_i \land y \le c_i \tag{3.9}$$

$$\Rightarrow c_i$$
 is an upper bound of  $\{x, y\}$  (3.10)

Since p is established to be the least upper bound, it must be that

$$p \le c_i \text{ with } c_i \in C_i \tag{3.11}$$

$$\Rightarrow \exists c_i \in C_i \text{ such that } p \le c_i \tag{3.12}$$

This contradicts equation 3.4, thus forcing p to be compact!

4 A partially ordered set D is a complete lattice if every subset S of D has a least upper bound  $\sqcup S$ . Show that in a complete lattice D, an element e is compact if and only if for all  $S \subseteq D$ :  $e \leq \sqcup S$  implies  $e \leq \sqcup X$  for some finite  $X \subseteq S$ .

## 5 Provide a denotational semantics for "for" loops given in Assignment 1.

$$S_{ds} \llbracket \text{for } i = E1 \text{ to } E_2 \text{ step } E_3 \text{ do } St \rrbracket$$
 (5.1)

$$=\mathcal{S}_{ds}\llbracket i=0; \text{ for } i=i+E_1 \text{ to } E_2 \text{ step } E_3 \text{ do } St \rrbracket$$

$$(5.2)$$

$$= \mathcal{S}_{ds} \llbracket \text{for } i = i + E_1 \text{ to } E_2 \text{ step } E_3 \text{ do } St \rrbracket \circ \mathcal{S}_{ds} \llbracket i = 0 \rrbracket$$

$$(5.3)$$

$$=\operatorname{cond}(\mathcal{B}\llbracket i < E_2 \rrbracket, \mathcal{S}_{ds} \llbracket St : \text{for } i = i + E_1 \text{ to } E_2 \text{ step } E_3 \text{ do } St \rrbracket, \text{id}) \circ \mathcal{S}_{ds} \llbracket i = 0 \rrbracket$$

$$(5.4)$$

$$=\operatorname{cond}(\mathcal{B}[i < E_2], \mathcal{S}_{ds}[\text{for } i = i + E_1 \text{ to } E_2 \text{ step } E_3 \text{ do } St] \circ \mathcal{S}_{ds}[St], \operatorname{id}) \circ \mathcal{S}_{ds}[i = 0]$$

$$(5.5)$$

Therefore:

$$S_{ds}[for \ i = i + E_1 \ to \ E_2 \ step \ E_3 \ do \ St] \circ S_{ds}[i = 0]$$
 (5.6)

$$=\operatorname{cond}(\mathcal{B}[[i < E_2]], \mathcal{S}_{ds}[[for \ i = i + E_1 \ to \ E_2 \ step \ E_3 \ do \ St]] \circ \mathcal{S}_{ds}[[St]], id) \circ \mathcal{S}_{ds}[[i = 0]]$$

$$(5.7)$$

Or short:

$$S_{ds} \llbracket \text{for } i = i + E_1 \text{ to } E_2 \text{ step } E_3 \text{ do } St \rrbracket$$
 (5.8)

$$=\operatorname{cond}(\mathcal{B}[i < E_2], \mathcal{S}_{ds}[for \ i = i + E_1 \text{ to } E_2 \text{ step } E_3 \text{ do } St] \circ \mathcal{S}_{ds}[St], id)$$

$$(5.9)$$

By expressing this as a fixed point of the functional F we get

$$S_{ds}[for i = i + E_1 \text{ to } E_2 \text{ step } E_3 \text{ do } St]$$

$$(5.10)$$

$$= FIX F \tag{5.11}$$

where 
$$Fg = \operatorname{cond}(\mathcal{B}[i < E_2], g \circ \mathcal{S}_{ds}[St], \operatorname{id})$$
 (5.12)

Since

$$S_{ds}[for i = E1 \text{ to } E_2 \text{ step } E_3 \text{ do } St]$$

$$(5.13)$$

$$= \mathcal{S}_{ds} \llbracket \text{for } i = i + E_1 \text{ to } E_2 \text{ step } E_3 \text{ do } St \rrbracket \circ \mathcal{S}_{ds} \llbracket i = 0 \rrbracket$$
 (5.14)

We finally get for the denotational semantic of the for loop:

$$S_{ds} \llbracket \text{for } i = E1 \text{ to } E_2 \text{ step } E_3 \text{ do } St \rrbracket$$
 (5.15)

$$= FIX F \circ s[i \to \mathcal{A}[0]s]$$
 (5.16)

where 
$$Fg = \operatorname{cond}(\mathcal{B}[i < E_2], g \circ \mathcal{S}_{ds}[St], \operatorname{id})$$
 (5.17)

## 6 Provide a denotational semantics for "case" statements as specified in Assignment 1.

$$Cl \to Cl; n: St$$
 (6.1)

$$\mathcal{S}_{ds}\llbracket Cl\ e \rrbracket = \operatorname{cond}(\mathcal{B}\llbracket n == e \rrbracket, \mathcal{S}_{ds}\llbracket St \rrbracket, \mathcal{S}_{ds}\llbracket Cl\ e \rrbracket)$$
(6.2)

And therefor:

$$S_{ds}[Cl\ e] \tag{6.3}$$

$$= FIX F \tag{6.4}$$

where 
$$Fg = \operatorname{cond}(\mathcal{B}[n == e], \mathcal{S}_{ds}[St], g)$$
 (6.5)

$$Cl \to n : St$$
 (6.6)

$$S_{ds}[Cl\ e] = \operatorname{cond}(\mathcal{B}[n == e], S_{ds}[St], id)$$
(6.7)

$$Cs \to \text{case } E1 \text{ of } Cl$$
 (6.8)

$$\mathcal{S}_{ds}[\![Cs]\!] = \mathcal{S}_{ds}[\![Cl\ E1]\!] \tag{6.9}$$
